FirstProgram.java

Read through the code for FirstProgram.java. Use the run button to run the code.

Some of the most common syntax errors for introductory Java students are:

- * missing a semicolon
- * curly braces or brackets that do not match up
- * missing a + in String concatenation
- * misspelling or messed up capitalization

For the next few questions, you will introduce syntax errors, try to run FirstProgram, and report on the error message.

Your answer

What error do you get when you remove the opening bracket { for **public static void main**? *

Your answer

What error do you get when you remove one of the + signs in string concatenation? *

Your answer

What error do you get if you change String to string and try to run the program? *

Your answer

ForLoop.java

Open ForLoop.java, and run it. It should create a rectangle made up of * characters.

We will make a few changes to the code to try to figure out what each piece means.

What happens when you change numRows and numCols to different values? *
How do you think numRows and numCols affect the code?

Your answer

open class members, java, kotlin

What are two questions you have about this code. It could be the new syntax, or how it works, or what it means.

Your answer
