

CS258 Midterm

How to run FlagMaker

VS Code version

Flag Maker Project Download Instructions

- Prerequisites:
 - Java 21 and above
- Download and unzip / extract FlagMaker-vscode.zip
- Double-click the `midterm.code-workspace` file to open VS Code
- Copy the appropriate `.jar` file from `tmp/` to `lib/`
 - See next slide for details

Which .jar file to use?

- In the tmp folder, find the .jar file that corresponds to your computer and operating system.
- Copy it from the tmp folder to the lib folder.
 - app-windows.jar is for Windows, so keep this one if you are using Windows.
 - app-mac.jar is for Mac with Intel CPUs. How to check your Mac CPU type
 - app-mac_aarch64.jar is for the newer Apple Silicon M1/M2 chips.
 - app-linux.jar should work with any Linux distro

Java Extensions for VScode

- Make sure you have “Java Extensions” from Microsoft installed
 - The Oracle extension are the wrong extensions
- Main starts the program
- Run button should say “Run Java”
 - if it says “Run Code” you probably have the Oracle extension installed

Where to program your code?

- Write code into `FlagMaker.java`
- Run with `Main`
- Reference examples are in `CS258-Midterm-Flagmaker.pdf`
 - Make your own flags

Troubleshooting: 3 most common issues

- Did you open by double clicking `midterm.code-workspace`
 - **DO NOT** use File => Open Project
 - This will not configure the libraries
- Did you copy the correct `.jar` from `tmp/` to `lib/`?
- Do you have the Oracle extensions installed?
