Your answer

Test Questions

Answer the following questions to the best of your knowledge.

What is the primary limitation of using only one processor to complete a task? *

- ☐ It can only access local files, making the process slower
- ☐ It uses too much memory, making the process slower
- ☐ It causes data corruption
- ☐ It must complete each step one at a time, making the process slower

What is a potential drawback of using multiple processors? *

- ☐ Multiple processors can cause overheating requiring expensive cooling techniques
- ☐ Multiple processors can cause the computer to run out of RAM
- ☐ The processors may finish at different times, causing some to sit idle with no work
- ☐ The processors are able to complete the task faster

Speedup: True or False: Speedup is defined as the ratio of the time taken to solve a problem on a single processor to the time taken on a parallel system. *

- ☐ True
- ☐ False

Contention: Multiple Choice: What is contention in parallel computing? *

- ☐ When multiple processors are waiting on (competing for) shared resources.
- ☐ The ability of a system to handle a growing amount of work.
- ☐ The process of dividing (breaking down) a task into smaller sub-tasks.
- ☐ The increase in computational speed by adding more processors.

Scalability: True or False: Scalability refers to the ability of a parallel system to increase its performance proportionally with the addition of more processors. *

- ☐ True
- ☐ False

Race Condition: Multiple Choice: What is a race condition in the context of parallel computing? *

- ☐ Where one processor finishes the task before others start
- ☐ Where multiple processors try to access or modify shared data simultaneously
- ☐ A scheduling technique that improves processor speed and synchronization
- ☐ A timeout that resets processor tasks
