

Homework 3

Due: Friday 4/11 at 11:59pm

Building on the given code, complete the problems below. (Remember to open the project by unzipping the file and clicking on `hw3.code-workspace`.) The given code contains some of the linked list code that we've been developing in class, including our `get` method from 4/9.

Submit your work as a .zip file of the directory and submitted through Google Classroom. Name your file based on your name or username so that it's clearly yours.

1. (6 points) Write test cases for the `get` method. As observed in class, our implementation includes some errors so it should fail at least one of your test cases.
2. (6 points) Fix the given `get` method just by adding appropriate if statements. (In other words, do not modify the given code other than adding one or more if statements and their bodies. The given code should still be used in the majority of cases; you are just fixing the special cases where it is incorrect.) This version should pass all the test cases.
3. (6 points) Comment out the `get` method and reimplement it using the “standard loop”. Again, this version should pass all the test cases.
4. (1 point) Write a collaboration statement at the top of the file `OurLinkedList.java`.
