

Homework 4

Due: Wednesday 4/16 at 11:59pm

Complete the problems below and submit just your .java file(s) through Google Classroom. (I don't need the .txt file.)

Here are the problems:

1. (18 points) Complete Lab 3 so that it reads lines from the file `input.txt`, prints the number of distinct lines, and then prints each of them in order of decreasing frequency (including a number to indicate the frequency). Be sure to use the approach described in the lab (maintaining a sorted list of objects, each with one string and its frequency).
2. (1 point) At the top of your submission, put a statement about collaboration in a comment. This should either be "I didn't work with anyone" or a description of who you talked with about the assignment and what you talked about. (For example: "David helped me get started, X and Y and I reviewed loops together, and I helped X debug the if statement.")
